---

The process for installing ISPmanager on your server isn't complicated. This is because the ISPmanager system has an auto-installer that will guide you through the entire installation process. Please see the step-by-step directions outlined below:

- Login to your virtual/dedicated server via SSH
- Next, run the following command within Linux:

```
# wget http://download.ispsystem.com/install.sh && sh install.sh
```

- Follow on onscreen instructions outlined within

During the installation process, you will need to make selections deciding on the type of configuration you wish to have. However, you will be able to change that configuration style at a later date if needed.

If you have any further questions pertaining to your [ISPmanager license](#), please feel free to get in contact with the LicenseCube support team for additional assistance.
