Prior to the release of Plesk SiteBuilder version four (4.0), Plesk SiteBuilder disabled `safe_mode` within PHP due to compatibility issues. It was necessary to perform the below-based instructions to re-enable it. However, since the release of Plesk SiteBuilder 4.0 this process is no longer necessary.

Plesk SiteBuilder 3.0 and below:

- Login to your Virtual/Dedicated server via SSH
- Next, make the necessary adjustments to your central `php.ini` file
- Upon completion, simply run the following command:

```
# /etc/init.d/httpd restart
```

- After apache has been restarted the new settings should be applied!

If you have any further questions pertaining to your [Plesk SiteBuilder license](#), please feel free to get in contact with the LicenseCube support team for further assistance.
